**Source Code:** This is human understandable code that's written in english.

**Byte Code:** Here we use the compiler called **"javac"**. It's intermediate code that's converted into the byte code (.class) and this is platform independent code.

**Native Code:** From byte code, it's converted into Native code with the help of JVM. That's understandable by machine.

Source Code to Byte Code to Native Code

Java is both Compiled and Interpreted Language
